

I am writing to express my concerns over the above application.

I believe the application is a regurgitation of the previous application which failed. No doubt in the hope that now there isn't an election due councillors will reconsider their last decision.

I think my biggest concern is that this technology is now outdated. The carbon cost of manufacture, and the cost to dispose of the panels at life end (not to mention the massive battery and inverter kit which have an additional expense and afterlife at the end of their working life) are massively detrimental to the environment.

The war in Ukraine and the subsequent runaway inflation was a timely reminder that this country needs to have security for its food production. This project plans to take this food producing land out of production for 30+ years. This could prove extremely costly to future generations if not I admit extremely profitable to Enzo who will no doubt "flip" the project if successful.
